

Smart Messaging App

Name: Divya Kharode
MIS. No. : 141903009

Introduction

- The Smart Reply Messaging App generates reply suggestions based on the full context of a conversation, and not just a single message, resulting in suggestions that are more helpful to your users.
- Smart Reply is intended for casual conversations in consumer apps. Reply suggestions might not be appropriate for other contexts or audiences.
- Smart Reply helps your users respond to messages quickly, and makes it easier to reply to messages on devices with limited input capabilities.

Dependencies

- Android Studio 4.1.
- Firebase ML-Toolkit's Smart Reply API.
- ML Kit Android libraries.

Firebase

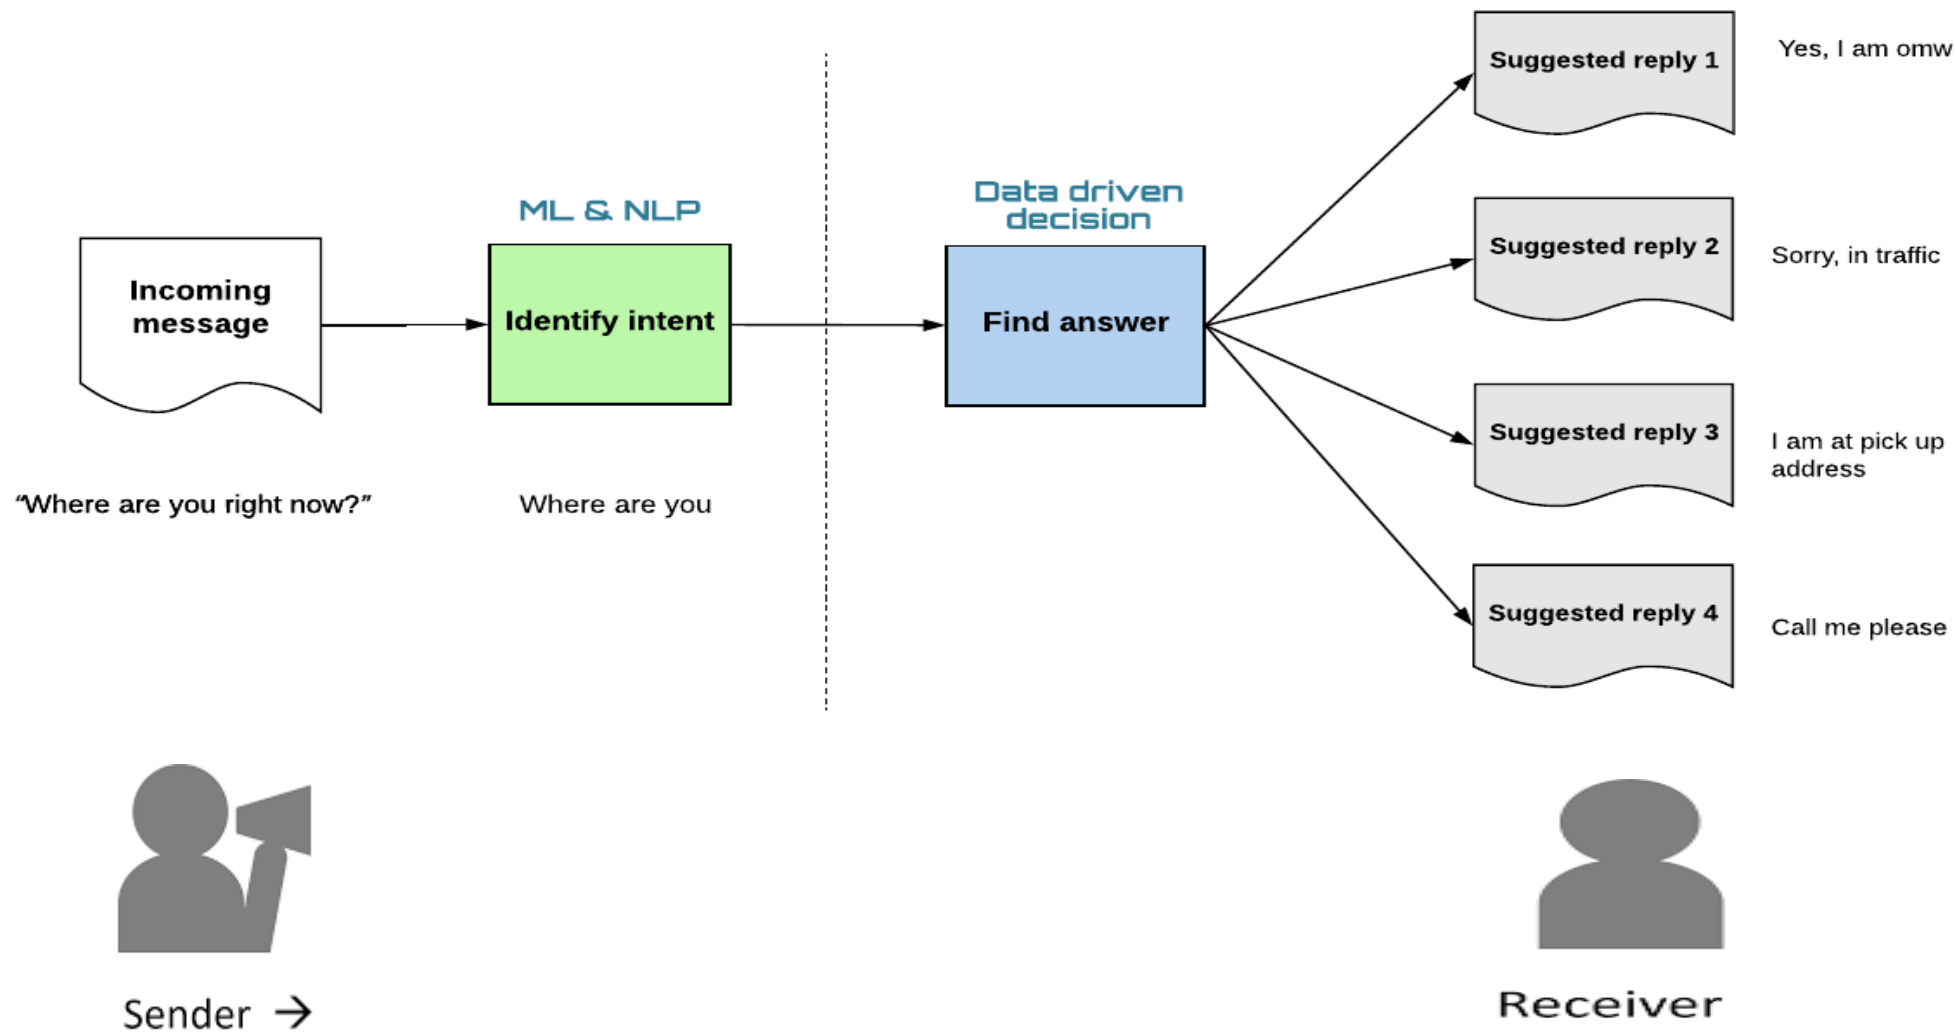

How Model Works

- The model uses up to 10 of the most recent messages from a conversation history to generate reply suggestions.
- It detects the language of the conversation and only attempts to provide responses when the language is determined to be English.
- If the language is determined to be English and no sensitive topics are detected, the model provides up to three suggested responses. The number of responses depends on how many meet a sufficient level of confidence based on the input to the model.
